

### Regenerative Tissue Therapy: *The future of health care*

Regenerative Medicine is the rapidly advancing area of medicine that can help repair injured and damaged tissue in the body that was not thought possible before. The types of regenerative therapies offered in this office are stem cells and platelet rich plasma.

These types Regenerative Tissues are a next generation non-surgical, minimally invasive treatment that uses the human body's own ability to heal, repair, and re-grow tissue.

Regenerative tissues used in this office are not from Planned Parenthood or from abortions. The stem cells used in this office are derived from planned cesarean sections. The parents have volunteered to provide the umbilical cord or amniotic tissues to a tissue bank. Testing of the parents is extensive before the birth, as well as on the umbilical cord or amniotic tissues after the birth to ensure your safety and follows laws governing tissue banks.

This type of treatment has been shown to be extremely effective in helping people with knee, shoulder, back, hand, neck, or foot pain, joint pain from arthritis, peripheral neuropathy and other types of pain from chronic disease.

### Is it affordable and is it covered by my insurance?

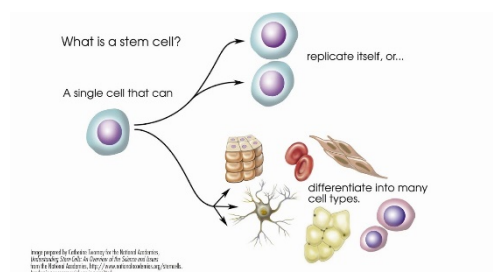

Compared to the cost of surgery and total hip or knee replacements, it is very cost effective. It is not covered by insurance. However, at our office, we have affordable financing options available. With the type of financing options we have virtually everyone can afford it. Most HSA or FLEX spending accounts CAN be used.

### Is Regenerative Tissue Therapy Safe?

YES! There have now been over 300,000 treatments and no adverse reactions. Because of its effectiveness and low risk, that this type of treatment will continue to become more and more popular.

### How does it work?

Regenerative Tissue uses the process your body has used your whole life to grow, repair, and replace damaged tissue. When we are born, we have a very big supply of the things needed to do these vital functions. By the time we have grown into our late teens, we have used 90 percent of our supply. For the rest of our lives we live on the

other 10 percent. Every time we have an injury, infection, wear and tear, or just aging, we continue using up our supply. For some people, the supply gets so low the body just can't keep up. Right/Left/Bilateral Hip

The Regenerative tissues we inject in your area of pain or problem is concentrated with the things you need to fix your problem. It helps your body have the tools needed to fix, repair or replace the damaged area.

### How is it different from the other types of treatments I have tried?

Most treatments for chronic pain or degenerative conditions are designed to only mask or cover up the pain. They are not designed to fix or repair whatever is causing the pain. Regenerative tissue treatments reduce or eliminate the pain by healing whatever is causing it. Not only does this get rid of your pain, it also helps restore function. Meaning the part of your body that was affected before works like it is designed to! You can live pain free and do the things that you love doing.

### Does it have a good chance for success?

Yes, it does! We know of nothing else that has a better chance. Regenerative Tissue contains grow factors, proteins, natural cytokines and mesenchymal stem cells to help repair and regrow tissue. The regenerative tissues are typically injected right into your problem area and are as concentrated as when you were developing and growing. This gives you the ability to repair injuries like when you were young.

### How do I know if it is right for me?

We would be happy for you to have a consultation with one of our medical professionals. They will go through your health and injury history and help you determine if these types of treatments may be right for you.
